

WELDED WIRE REINFORCEMENT (WWR)

Tree Island Steel produces quality Welded Wire Reinforcement (WWR) in sheets and rolls, for the construction and pre-cast industries. Wire reinforcement or wire fabric is an efficient and economical option for reinforcement in concrete construction.

Save time and money using Welded Wire Reinforcement over standard rebar methods.

- Wires are welded into a mat so that the wires do not move when concrete is placed, ensuring the wires are in their proper position.
- Sheets are uniform to fit most reinforcing applications.
- The optimum reinforcement is provided through the use of variable wire sizes and spacing.
- Available in rolls or sheets.

Welded Wire Reinforcement can be used for:

- Slab on grade
- Floor and wall systems
- Topping slabs
- Architectural precast wall panels
- Tilt-up construction wall systems
- Shear walls
- Retaining walls
- Mechanically Stabilized Earth (M.S.E.) reinforcement
